

AIX QHA

Article Number: 595 | Rating: Unrated | Last Updated: Mon, Jun 3, 2019 2:14 PM

The standard tool for cluster monitoring is **clstat**, which comes along with PowerHA SystemMirror/HACMP. Clstat is rather slow with its updates, and sometimes the required clinfo daemon needs restarting in order to get it operational, so this is, well, not perfect. There's a script which is also easy to use. It is written by PowerHA/HACMP guru [Alex Abderrazag](#). This script shows you the correct PowerHA/HACMP status, along with adapter and volume group information. It works fine on HACMP 5.2 through 7.2. You can download it here: [qha](#). This is version 9.06. For the latest version, check www.lpar.co.uk.

This tiny but effective tool accepts the following flags:

- -n (show network interface info)
- -N (show interface info and active HBOD)
- -v (show shared online volume group info)
- -l (log to /tmp/qha.out)
- -e (show running events if cluster is unstable)
- -m (show status of monitor app servers if present)
- -1 (exit after first iteration)
- -c (CAA SAN / Disk Comms)

For example, run:

```
# qha -nev
```

It's useful to put "qha" in /usr/es/sbin/cluster/utilities, as that path is usually already defined in \$PATH, and thus you can run qha from anywhere.

A description of the possible cluster states:

- ST_INIT: cluster configured and down
- ST_JOINING: node joining the cluster

- ST_VOTING: Inter-node decision state for an event
- ST_RP_RUNNING: cluster running recovery program
- ST_BARRIER: clstrmgr waiting at the barrier statement
- ST_CBARRIER: clstrmgr is exiting recovery program
- ST_UNSTABLE: cluster unstable
- NOT_CONFIGURED: HA installed but not configured
- RP_FAILED: event script failed
- ST_STABLE: cluster services are running with managed resources (stable cluster) or cluster services have been "forced" down with resource groups potentially in the UNMANAGED state (HACMP 5.4 only)
