RHCS: Luci - the cluster management console

```
# Tested on RHEL 6

# The Red Hat High Availability Add-On includes a web based
management framework for
# deploying, configuring and managing a high availability cluster
known as Conga that
# includes two components: an agent running on all nodes, 'ricci',
and a management console
# called 'luci'

# All communications between 'luci' and 'ricci' are done through
default port 11111

# When 'luci' authenticates with a 'ricci' node for the first time,
the password for the
# local 'ricci' user on the node running 'ricci' will be used.
Authentication to the 'luci'
# console is handed via 'pam' on the node running 'luci'.
# Users other than 'root' will have zero privileges

# Installing 'luci'

yum install luci

chkconfig luci on

service luci start
```

```
# To connect to 'luci' management console:
```

```
https://<node_running_luci>:8084
```
